RIVERBANK GREENHOUSE LIGHTING PILOT · STEERING GROUP

The pilot supports deciding on another measurement cycle, not wider installation

12 of 18 plots had a positive yield difference

■ Positive difference (12) □ No positive difference (6). One square is one plot; square order has no meaning.

Median difference vs each site's reference plots

+6%

Range across the 18 plots

–3% to +14%

Pilot size

18 plots, 3 sites

Duration

One winter growing cycle

The evidence supports

- Deciding whether to run another measurement cycle.
- Reporting the result as a median +6% difference, with the –3% to +14% plot range and 12 of 18 plots positive.

It does not yet support

- **Saying lighting caused the difference.** Plots were not randomly assigned, and crop mix and baseline conditions differed between sites.
- **Wider installation on yield alone.** Installation cost and energy use were not measured, and wider installation has not been
