Authorize another measurement cycle before considering wider installation.

WHAT THE PILOT OBSERVED

+6% median yield difference

Versus each site's reference plots

12 of 18 positive 6 of 18 not positive

Individual plot differences **−3% to +14%**

18 plots · 3 sites · one winter growing cycle

WHAT THE EVIDENCE SUPPORTS NEXT

Run another measurement cycle.

Track yield alongside installation cost and energy use to inform any later decision on wider installation.

Interpret with care: plots were not randomly assigned; crop mix and baseline conditions differed between sites. The observed yield difference does not establish that lighting caused it.

Cost and energy use were not measured in this pilot.

Wider installation has not been approved.
