What should we do next?

Authorize one more measurement cycle. The pilot is promising enough to investigate further, but it does not yet support wider installation.

12 of 18 plots positive

6 of 18 were not

What the pilot covered

18 greenhouse plots · 3 sites · 1 winter growing cycle

Read the result with care

- Plots were not randomly assigned.
- Crop mix and baseline conditions differed by site.
- Yield differences are observed associations; the pilot does not show lighting caused them.

Decision requested

Approve another cycle to check whether yield patterns repeat and measure **installation cost** and **energy use** before any wider-installation decision.
