RIVERBANK GREENHOUSE LIGHTING PILOT · STEERING GROUP

The pilot supports another measurement cycle, not wider installation

WHAT THE PILOT MEASURED

Scope
18 plots
at 3 sites, one winter growing cycle

Median yield difference
+6%
versus each site's reference plots

Plots with a positive difference
12 of 18
plots; 6 did not

Individual plot differences
−3% to +14%
range across plots

THE EVIDENCE SUPPORTS

- Deciding whether to run another measurement cycle, which the group can authorize.
- Reporting the +6% median yield difference as a pilot result, shown with its spread (−3% to +14%).

IT DOES NOT SUPPORT

- Saying lighting caused the yield differences: plots were not randomly assigned.
- Wider installation on yield alone: installation cost and energy use were not measured.

Open for decision: another measurement cycle. **Not supported yet:** wider installation.

Fictional scenario; all figures are invented for the evaluation. Yield differences are relative to each site's reference plots.
