RETROFIT FEEDBACK · PROGRAM LEADS

# Neither “most common overall” nor “improved” is established

Two partner snapshots answer different parts of the question, with incompatible scopes and no comparable baseline.

## Barrier signals · keep sources separate

| | |
|---|---|
| **North · installer scheduling** | **28 / 40** survey respondents |
| **North · upfront cost** | **17 / 40** survey respondents |
| **North · unclear eligibility** | **9 / 40** survey respondents |

North allowed multiple selections, so counts overlap. South: 9 of 15 reviewed open cases mentioned waiting for an installer; other barriers were not systematically recorded. Case denominator is not homeowners served.

## Service turnaround · South only

**8 days** median among 11 cases with recorded times

4 of 15 reviewed cases had no time recorded. “Around two weeks last spring” is an unmethoded note with no identified cases or sample size; it is not a comparable baseline.

## To answer confidently, collect

- Shared period and population definitions; homeowner denominators for both partners.
- Consistent barrier categories and recording, including whether multiple barriers can be selected.
