RIVERBANK · STEERING GROUP

Evidence supports measuring again—not wider installation yet

A one-winter pilot shows a positive median yield difference, but not a causal or cost case.

+6% median yield difference

Compared with each site's reference plots
Plot differences ranged from –3% to +14%

12 / 18 positive **6 / 18** not positive

18 plots · 3 sites · one winter growing cycle

DECISION NOW

Authorize another measurement cycle

Use it to test whether the yield pattern holds and to fill the decision-critical gaps:

- installation cost
- energy use
- comparability across sites and plots

Interpret with caution: plots were not randomly assigned; crop mix and baseline conditions differed by site. The pilot does not establish that lighting caused the differences. Cost and energy use were not measured; wider installation has not been approved.
