RIVERBANK · SUPPLEMENTAL LIGHTING PILOT

Authorize another measurement cycle—not wider installation yet.

WHAT WAS OBSERVED

+6%

Reported median yield difference versus each site's reference plots.

–3% to +14%

Individual plot differences; **12 of 18** plots positive, 6 not.

WHAT THE EVIDENCE CAN SAY

18 plots · 3 sites · one winter growing cycle.

This is an observed difference, **not proof lighting caused it.**

Plots were not randomly assigned; crop mix and baseline conditions differed between sites.

> **Next decision:** use the available authority to run another measurement cycle. Measure installation cost and energy use alongside yield before considering wider installation.

Scope: this pilot covers three sites and one winter cycle only. Cost and energy use were not measured, so yield alone cannot establish whether wider installation is worthwhile.
