PROGRAM LEADS · EVIDENCE CHECK

Neither “most common overall” nor “improved” is established

Two partner summaries answer different questions—and neither supports the cross-period claim.

Barrier frequency · not rankable overall

28 / 40

North survey respondents selected installer scheduling

- Multiple selections allowed: counts overlap.
- Also selected: upfront cost **17**; unclear eligibility **9**.
- South: **9 of 15 reviewed cases** mentioned waiting for an installer; other barriers may also be present.

South’s total homeowners served is unknown. These are unlike units and scopes; do not pool or rank across partners.

Service turnaround · change unknown

8 days

South recent median; time recorded for 11 of 15 reviewed cases

> **Not evidence of improvement.**
> “Around two weeks last spring” has no identified cases, sample size, or method; it is not a comparable baseline.

- Four recent cases had no time recorded.
- North reported no turnaround times.

TO IDENTIFY THE OVERALL BARRIER

Collect both partners’ data with a shared period, population and denominator; define barrier categories and how multiple selections are handled.

TO TEST IMPROVEMENT

Use the same turnaround definition, coverage and method at baseline and follow-up; report sample size and missing times for both.

Source: supplied fictional partner summaries. No shared period definition, common denominator, or comparable baseline.
