RIVERBANK GREENHOUSE LIGHTING · STEERING GROUP

What should the pilot evidence support next?

RECOMMENDED DECISION

Authorize another measurement cycle.

Use the next cycle to measure yield alongside installation cost and energy use before considering wider installation.

OBSERVED YIELD DIFFERENCE

+6%

median vs each site's reference plots

18 plots · 3 sites · 1 winter growing cycle

Plot differences: **−3% to +14%**
12 of 18 plots had a positive difference; 6 did not.

Interpret cautiously: plots were not randomly assigned; crop mix and baseline conditions differed between sites. The pilot does not establish that lighting caused the observed differences.

Decision limit: installation cost and energy use were not measured. The steering group can authorize another measurement cycle; wider installation has not been approved.

Observed pilot result · association only · not a causal estimate
