PROGRAM LEADS · INTAKE EVIDENCE

We can’t identify the overall barrier or confirm faster service.

The two partner summaries use different populations and methods, so their counts cannot establish an overall ranking or a change over time.

Partner North

Homeowner survey · n=40

28 selected installer scheduling

Also selected: **upfront cost 17**; **unclear eligibility 9**.

Multiple selections allowed: categories overlap, so counts are not parts of a whole.

No service-turnaround times were included.

Partner South

Open case review · 15 cases

9 cases mentioned waiting for an installer

Other barriers were not recorded; homeowners served overall is unknown.

Turnaround: median 8 days for 11 cases; 4 had no time recorded.

“Around two weeks last spring” is an unmethoded note with no case IDs or sample size, so it is not a comparable baseline.

What would answer both questions?

Use a shared period and consistent reporting rules across partners.

- Homeowners served denominator
- Same barrier definitions + overlap rule
- All barriers recorded
- Comparable turnaround baseline + current measure
- Coverage and missing-time counts

Current evidence does not support an overall ranking or improvement claim.

Counts shown within each source only
