STEERING GROUP · DECISION

Authorize another measurement cycle—not wider installation yet.

WHAT TO DO NEXT

> **Measure again** to test whether the yield signal holds, while collecting installation cost and energy-use data.

The pilot can inform whether to measure next; it does not establish a case for rollout.

OBSERVED YIELD SIGNAL · ONE WINTER CYCLE

Median difference vs each site's reference plots: +6%

Across 18 plots: individual differences ranged from –3% to +14%.

12 / 18
plots had a positive yield difference

3 sites
18 greenhouse plots tested

Limits: plots were not randomly assigned; crop mix and baseline conditions differed between sites. The observed difference is not proof lighting caused higher yields. Installation cost and energy use were not measured.
